

General E-commerce Website

Step 1: Define Technical Requirements

Frontend UI/UX Design

- Home Page: featured products, categories, search bar.
- Product Listing Page: list of products.
- Product Details: Price, reviews, description, "Add to Cart" button.
- Cart Page: Total and products list, "Proceed to Checkout" button.
- Checkout Page: Address, payment options (Credit, PayPal), order summary.
- User Confirmation: "Thank You" message, order tracking link.

2. Backend (Sanity CMS)

- Step 1: Sanity CMS create Account
Sanity CLI install in your project.

- Step 2: Schema Design Karin

Sanity define a entities :

Product Schema: Name, price, image, stock, description.
Order Schema: Customer details, purchased items, total amount.
Customer Schema: Name, email, address, previous orders.

- Step 3: Data Fetching Setup :

fetch data from sanity to display products on frontend .

use sanity api to show :
orders , customers , shipment tracking , payment gateway

3. Third-Party API Integration

Third-party API get and use shipment tracking, payment processing, and backend functionalities .

- Step 1: Payment Gateway integrate Karin

use Stripe or paypal for payment process.
Create Account and generate api keys

- Step 2: Shipment Tracking API integrate

Use Shippo, EasyPost, or FedEx APIs to show the user where the order status

- Step 3: Product Data API Setup:

create a schema in the sanity and get api to set up your products .

Api Requirements

End Point	Methods	purpose	Response Example
/Product	Get	Fetch products	{id:123 , imageurl ,stock:10,etc}
/Orders	Post	create order	{order id:123 , status : In Transit}
/Shipment	Get	Get order shipment status	{order id:234 , status : success}

2. Design System Architecture
